

Mixed Effects Regression Article

1 Finding a Study

2 Data Cleaning

Here's the cleaning I did to the original data file available for download in the paper:

```
#| eval: false
```

```
dat <- read_csv('mice.csv')
```

```
weight <- dat[1:3,] fat <- dat[7:9,] lean <- dat[13:15,]
```

```
weight <- data.frame(t(weight)) colnames(weight) <- weight[1,] weight <- weight[-1,] weight$subject <- -1 :  
30weight$diet <- rep(c("Control", "Sema", "CR"), each = 10) rownames(weight) <- NULL weight <- weight  
|> pivot_longer(cols = c("0 month", "2 month", "4 month"), names_to = "months", values_to = "weight")  
weight$months <- rep(c(0,2,4), 30)
```
